

ANLEITUNG

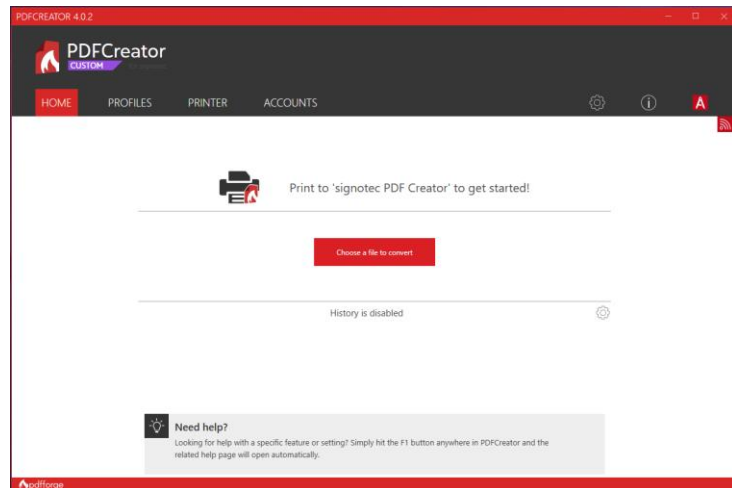

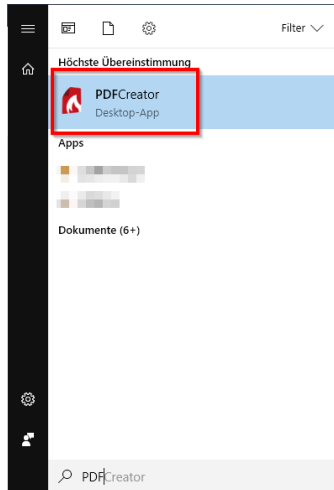

signotec PDF-Creator
Profil manuell erstellen

Für pdfforge PDFCreator v4

1) Start PDF-Creator

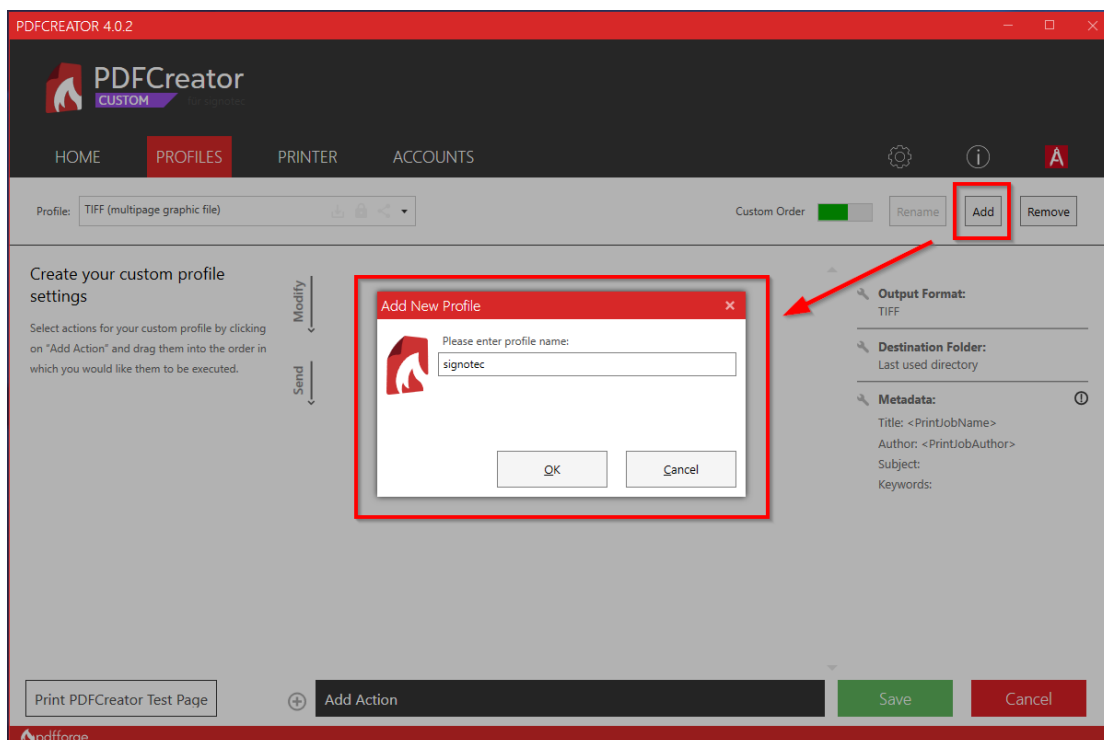

Start the "**PDFCreator.exe**" via the Windows start menu or via the installation directory. Alternatively, you can also search for PDFCreator.exe on your PC using the Windows search function.

Example: "C:\Program Files\PDFCreator\PDFCreator.exe"

2) Create profile

Switch to the "**Profiles**" tab. If there is no "**signotec**" entry in the list, you can use the "**Add**" button to create a new profile with this name.

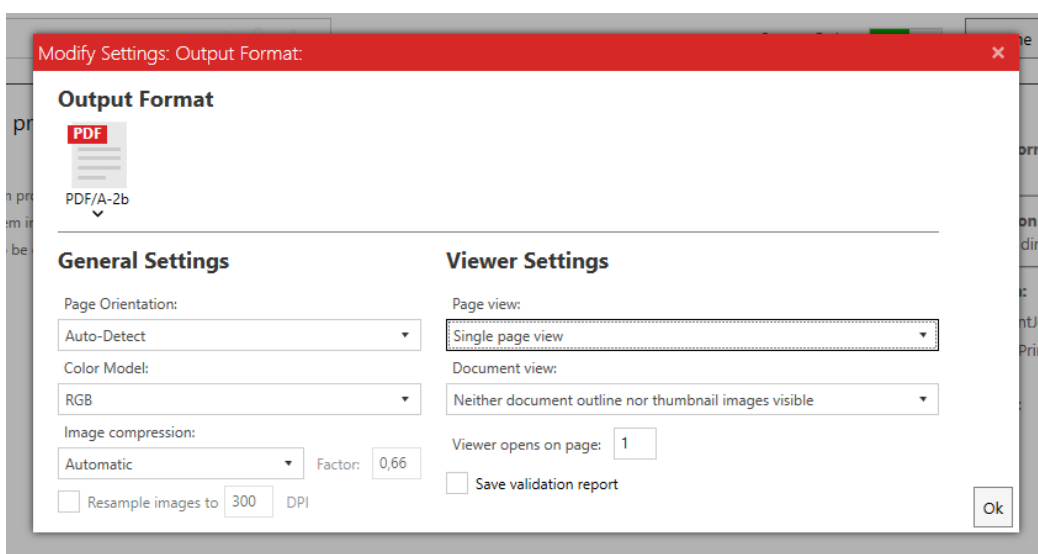

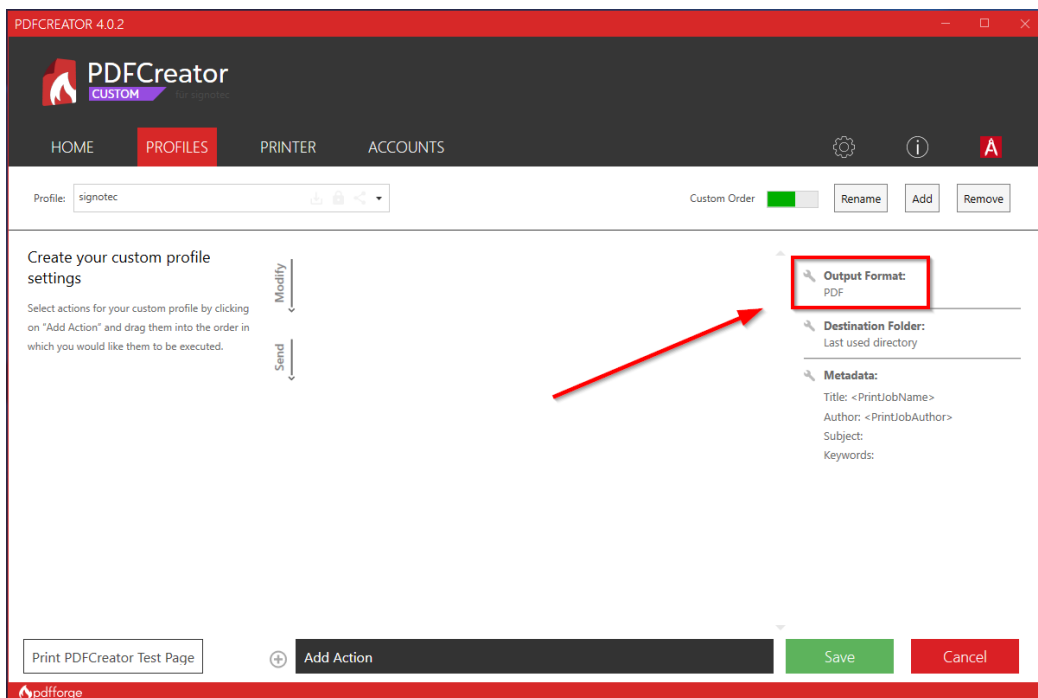

3) Configure profile

After you have created the profile, select the "signotec" profile in the "Profiles" tab to change the associated settings.

a. Output format

On the right side you will find "Output Format". Press the wrench to make the settings. A new window opens in which you can make the output format and the settings for the PDF. We recommend using the "PDF/A-2b" format.

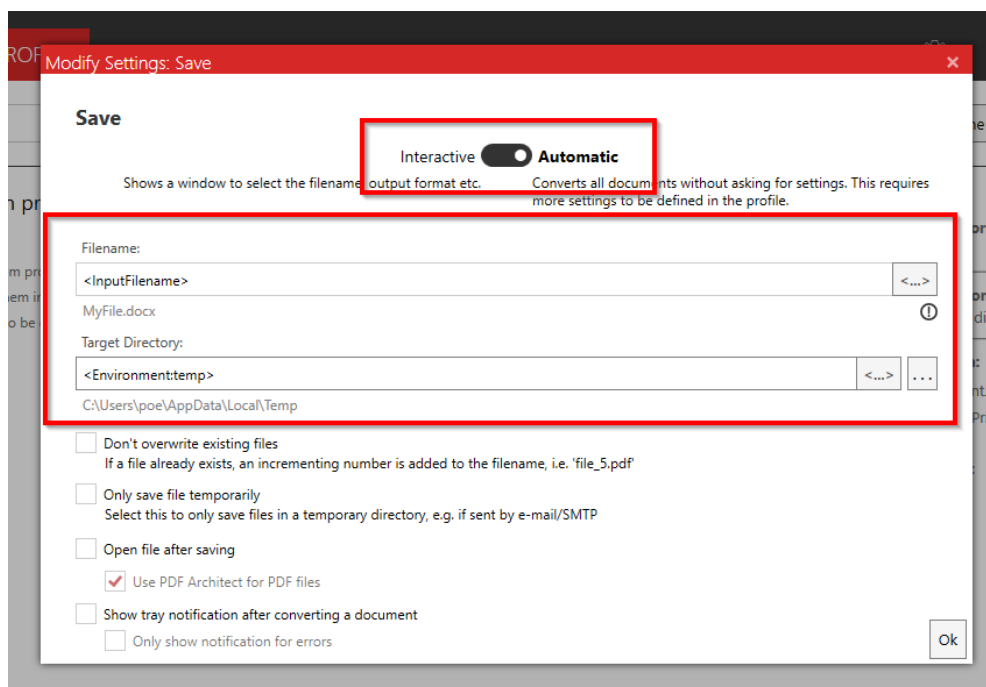

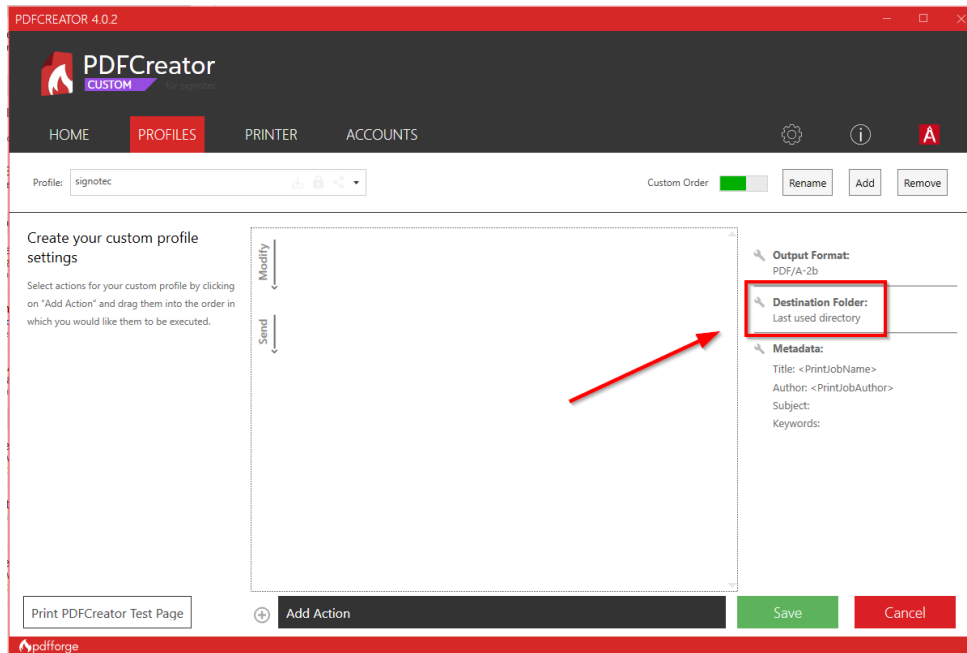

b. Destination folder

Next, press the wrench in the "Destination Folder" area. A new window opens again. Here it is configured where and with which name the temporarily required PDF file is saved. We recommend the following settings:

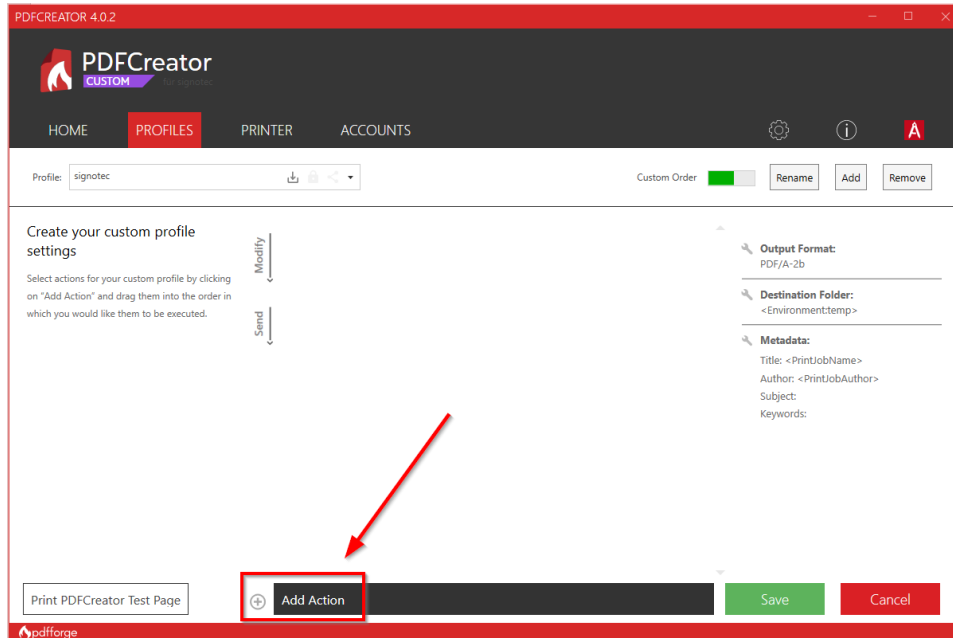

- **Save Mode = Automatic**
- **Target Directory = <Environment:temp>**

You should also **deactivate** all other settings in the lower area.

c) Add action

So that the file is also opened automatically in signoSign/2, this must be configured as an action. Click on "Add Action" in the lower area. A new window is opening up.

Select "**Run Program**" as the action and **signoSign/2.exe** as the program file.

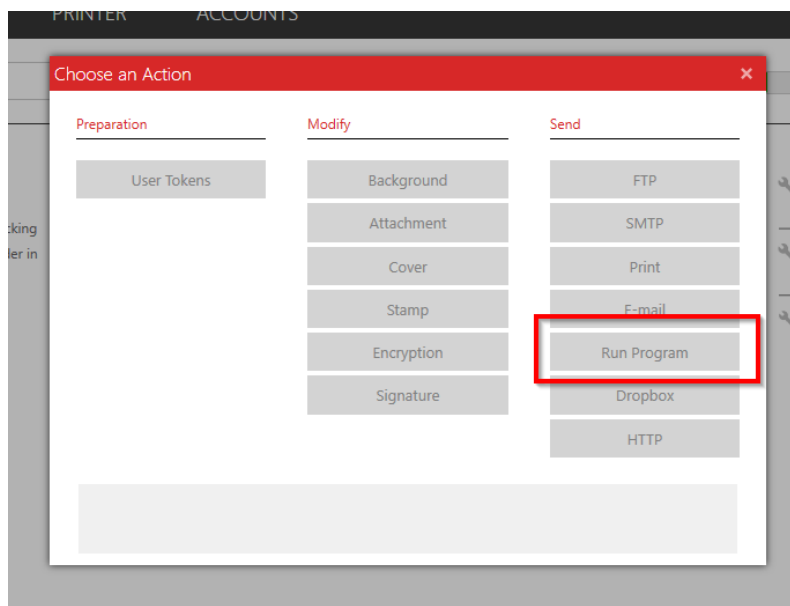

Standard 32-Bit:

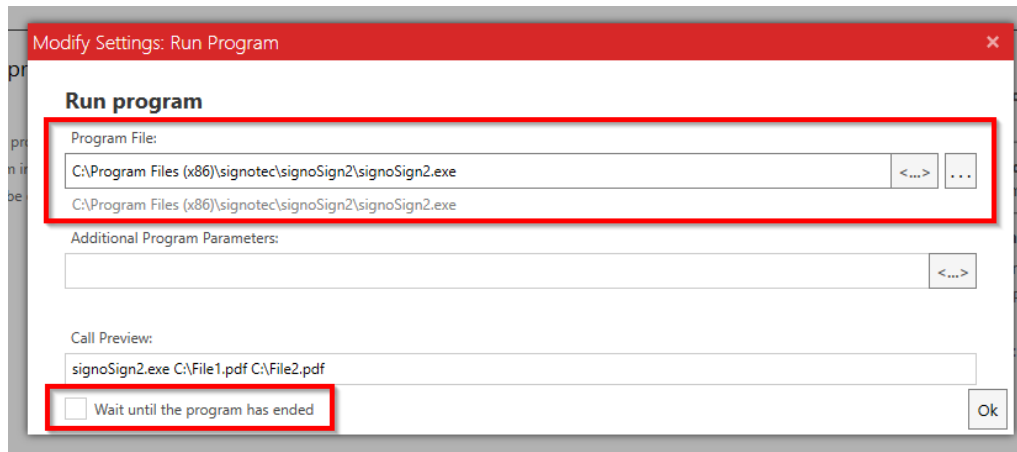

C:\Program Files (x86)\signotec\signoSign2\signoSign2.exe

Standard 64-Bit:

C:\Program Files\signotec\signoSign2\signoSign2.exe

You should also **deactivate** "**Wait until the program has ended**".

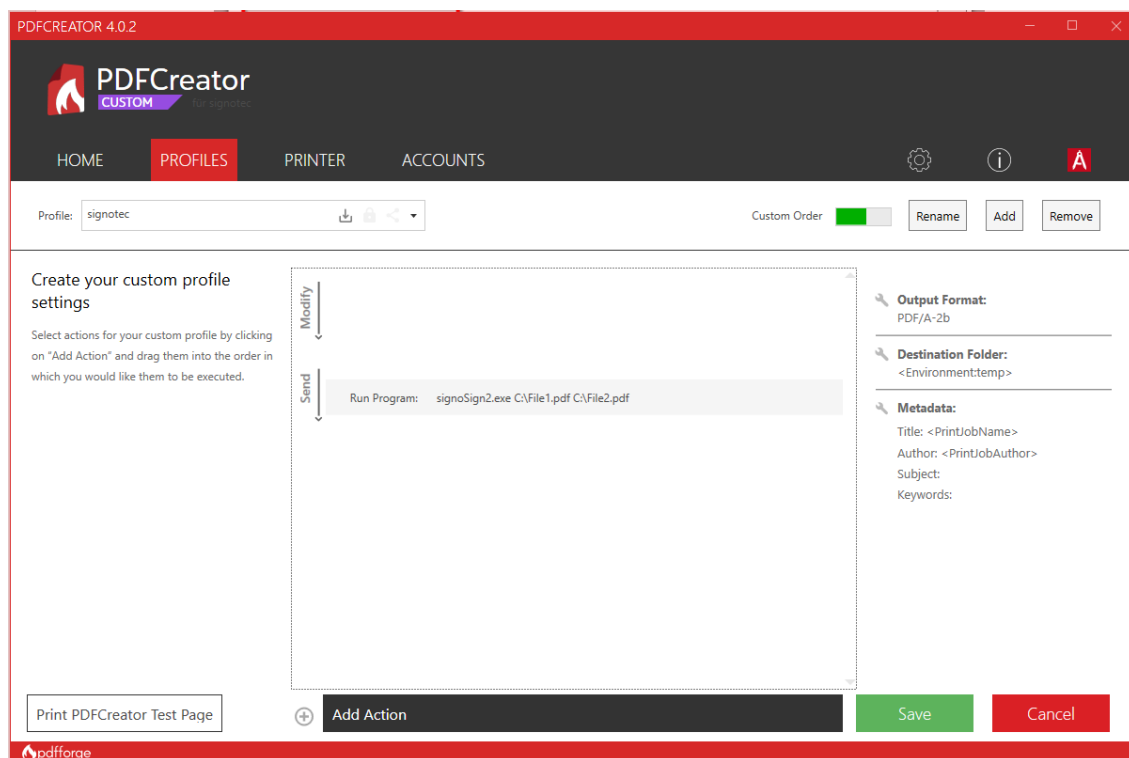

4) Profile overview

After you have created the profile, save it.

The full profile should now look like this:

5) Create printer

Switch to the "Printer" tab and select "**Add printer**" in the lower part of the window.

Use "**signotec PDF Creator**" as printer name (note the spelling!).

After you have created the printer, it will be shown in the list. Configure the signotec PDF Creator as the **primary printer** and select "**signotec**" as the **profile**.

The printer is now fully configured and can be used from any application to automatically convert files to PDF and start with signoSign/2.

The printer created should look like this:
